Assignment 7: GLMs (Linear Regressios, ANOVA, & t-tests)

Sophie Valkenberg

Fall 2024

OVERVIEW

This exercise accompanies the lessons in Environmental Data Analytics on generalized linear models.

Directions

1. Rename this file `<FirstLast>_A07_GLMs.Rmd` (replacing `<FirstLast>` with your first and last name).
2. Change "Student Name" on line 3 (above) with your name.
3. Work through the steps, **creating code and output** that fulfill each instruction.
4. Be sure to **answer the questions** in this assignment document.
5. When you have completed the assignment, **Knit** the text and code into a single PDF file.

Set up your session

1. Set up your session. Check your working directory. Load the tidyverse, agricolae and other needed packages. Import the *raw* NTL-LTER raw data file for chemistry/physics (`NTL-LTER_Lake_ChemistryPhysics_Raw.csv`). Set date columns to date objects.

2. Build a ggplot theme and set it as your default theme.

```
#1
library(tidyverse)
library(lubridate)
library(here)
library(cowplot)
library(ggplot2)
library(agricolae)
library(corrplot)

getwd()
here()

LTER_Lake_ChemPhys <- read.csv(
  file=here(
    "Data/Raw/NTL-LTER_Lake_ChemistryPhysics_Raw.csv"),
  stringsAsFactors = TRUE
)

LTER_Lake_ChemPhys$sampledate <- as.Date(
```

```
  LTER_Lake_ChemPhys$sampledate, format = "%m/%d/%y")

#2
mytheme <- theme(
  axis.text = element_text(color = "black"),
        legend.position = "top",
        plot.background = element_rect("#9073ab"))

theme_set(mytheme)
```

Simple regression

Our first research question is: Does mean lake temperature recorded during July change with depth across all lakes?

3. State the null and alternative hypotheses for this question: > Answer: H0: mean lake temperature recording during July changes with depth across all lakes Ha: mean lake temperature recording during July does not change with depth across all lakes
4. Wrangle your NTL-LTER dataset with a pipe function so that the records meet the following criteria:

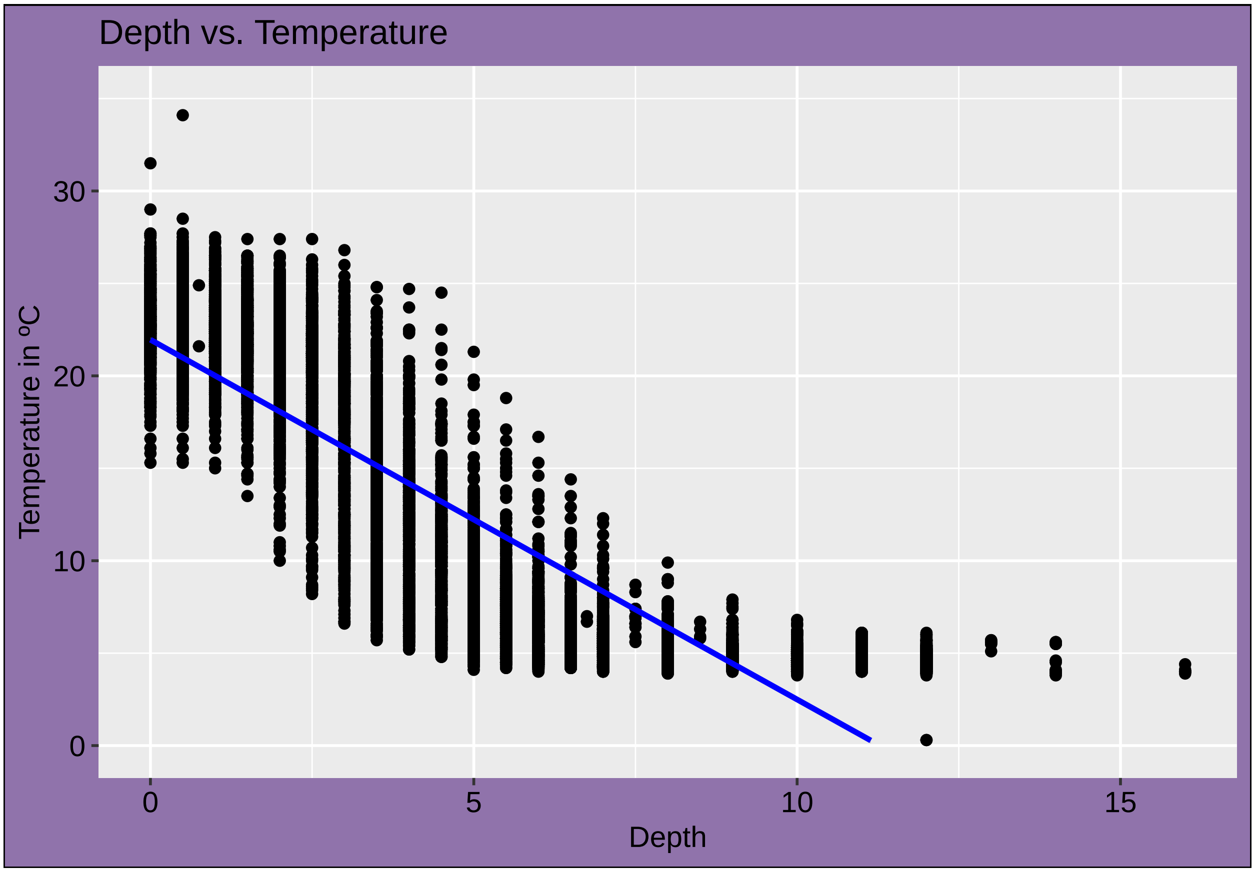
- Only dates in July.
- Only the columns: `lakename`, `year4`, `daynum`, `depth`, `temperature_C`
- Only complete cases (i.e., remove NAs)

5. Visualize the relationship among the two continuous variables with a scatter plot of temperature by depth. Add a smoothed line showing the linear model, and limit temperature values from 0 to 35 °C. Make this plot look pretty and easy to read.

```
#4
LTER_Lake_ChemPhys_Wrangled_SReg <-
  LTER_Lake_ChemPhys %>%
  mutate(Month = month(sampledate)) %>%
  filter(Month == 07) %>%
  select(lakename,year4,daynum,depth,temperature_C) %>%
  na.omit()

#5
LTER_SReg_ScatterPlot <-
  ggplot(LTER_Lake_ChemPhys_Wrangled_SReg, aes(x=depth,
                     y=temperature_C))+
  geom_point()+
  geom_smooth(method=lm, col="blue")+
  ylim(0, 35)+
  xlab("Depth")+
  ylab("Temperature in ºC")+
  ggtitle("Depth vs. Temperature")

print(LTER_SReg_ScatterPlot)
```



6. Interpret the figure. What does it suggest with regards to the response of temperature to depth? Do the distribution of points suggest anything about the linearity of this trend?

   Answer: According to the figure, the temperatures seem to be linearly and inversly associated with depth, as shown by the regression line. As the depth increases, the temperature decreases. It would interesting to see if these correlations are statistically signficiant.

7. Perform a linear regression to test the relationship and display the results.

```r
#7
depth_temp_regression <- lm(
  data = LTER_Lake_ChemPhys_Wrangled_SReg,
  temperature_C ~ depth)

summary(depth_temp_regression)
```

```
##
## Call:
## lm(formula = temperature_C ~ depth, data = LTER_Lake_ChemPhys_Wrangled_SReg)
##
## Residuals:
##     Min      1Q  Median      3Q     Max
## -9.5173 -3.0192  0.0633  2.9365 13.5834
##
```

```
## Coefficients:
##             Estimate Std. Error t value Pr(>|t|)
## (Intercept) 21.95597    0.06792   323.3   <2e-16 ***
## depth       -1.94621    0.01174  -165.8   <2e-16 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 3.835 on 9726 degrees of freedom
## Multiple R-squared:  0.7387, Adjusted R-squared:  0.7387
## F-statistic: 2.75e+04 on 1 and 9726 DF,  p-value: < 2.2e-16
```

```r
cor.test(
  LTER_Lake_ChemPhys_Wrangled_SReg$temperature_C,
  LTER_Lake_ChemPhys_Wrangled_SReg$depth)
```

```
##
##  Pearson's product-moment correlation
##
## data:  LTER_Lake_ChemPhys_Wrangled_SReg$temperature_C and LTER_Lake_ChemPhys_Wrangled_SReg$depth
## t = -165.83, df = 9726, p-value < 2.2e-16
## alternative hypothesis: true correlation is not equal to 0
## 95 percent confidence interval:
##  -0.8646036 -0.8542169
## sample estimates:
##        cor
## -0.8594989
```

8. Interpret your model results in words. Include how much of the variability in temperature is explained by changes in depth, the degrees of freedom on which this finding is based, and the statistical significance of the result. Also mention how much temperature is predicted to change for every 1m change in depth.

   Answer: The P-value is smaller than 0.05, which indicates that this relationship is statistically significant. According to R-squared value, 73.87% of the variability in temperature is explained by the changes in depth, also pointing to the significance of this correlation. Additionally, every 1 meter increase in depth is predicted to change by 1.95ºC , as indicated by the slope coefficient for depth. There are 9726 degrees of freedom for these results.

Multiple regression

Let's tackle a similar question from a different approach. Here, we want to explore what might the best set of predictors for lake temperature in July across the monitoring period at the North Temperate Lakes LTER.

9. Run an AIC to determine what set of explanatory variables (year4, daynum, depth) is best suited to predict temperature.

10. Run a multiple regression on the recommended set of variables.

```r
#9
LTER_AIC <- lm(data = LTER_Lake_ChemPhys_Wrangled_SReg, temperature_C ~ depth +
              year4 + daynum)
step(LTER_AIC)
```

```
## Start:  AIC=26065.53
## temperature_C ~ depth + year4 + daynum
##
##          Df Sum of Sq    RSS   AIC
## <none>                141687 26066
## - year4   1       101 141788 26070
## - daynum  1      1237 142924 26148
## - depth   1    404475 546161 39189
```

```
##
## Call:
## lm(formula = temperature_C ~ depth + year4 + daynum, data = LTER_Lake_ChemPhys_Wrangled_SReg)
##
## Coefficients:
## (Intercept)        depth        year4       daynum
##    -8.57556     -1.94644      0.01134      0.03978
```

```r
#10
LTER_MLR_Model <- lm(data = LTER_Lake_ChemPhys_Wrangled_SReg,
                     temperature_C ~ depth + year4 + daynum)
summary(LTER_MLR_Model)
```

```
##
## Call:
## lm(formula = temperature_C ~ depth + year4 + daynum, data = LTER_Lake_ChemPhys_Wrangled_SReg)
##
## Residuals:
##     Min      1Q  Median      3Q     Max
## -9.6536 -3.0000  0.0902  2.9658 13.6123
##
## Coefficients:
##              Estimate Std. Error  t value Pr(>|t|)
## (Intercept) -8.575564   8.630715   -0.994  0.32044
## depth       -1.946437   0.011683 -166.611  < 2e-16 ***
## year4        0.011345   0.004299    2.639  0.00833 **
## daynum       0.039780   0.004317    9.215  < 2e-16 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 3.817 on 9724 degrees of freedom
## Multiple R-squared:  0.7412, Adjusted R-squared:  0.7411
## F-statistic:  9283 on 3 and 9724 DF,  p-value: < 2.2e-16
```

11. What is the final set of explanatory variables that the AIC method suggests we use to predict temperature in our multiple regression? How much of the observed variance does this model explain? Is this an improvement over the model using only depth as the explanatory variable?

Answer: The final set of explanatory variables that the AIC method suggests we use to predict temperature in our multuple regression is (depth + year4 + daynum). The model showed that the AIC values of each step taken is greater than the starting AIC of the model, meaning that the inital model is the best fit for the linear regression. According to the summary of the model and the R-squared value, 74.11% of the variance can be explained by this model. This model shows a very slight improvement, by only 0.24%.

Analysis of Variance

12. Now we want to see whether the different lakes have, on average, different temperatures in the month of July. Run an ANOVA test to complete this analysis. (No need to test assumptions of normality or similar variances.) Create two sets of models: one expressed as an ANOVA models and another expressed as a linear model (as done in our lessons).

```r
#12

#ANOVA as aov
LTER_July_Lakes_Anova <- aov(data = LTER_Lake_ChemPhys_Wrangled_SReg,
                            temperature_C ~ lakename)
summary(LTER_July_Lakes_Anova)
```

```
##                Df Sum Sq Mean Sq F value Pr(>F)
## lakename        8  21642  2705.2      50 <2e-16 ***
## Residuals    9719 525813    54.1
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
```

```r
#ANOVA as lm
LTER_July_Lakes_Anova_asLM <- lm(data = LTER_Lake_ChemPhys_Wrangled_SReg,
                                temperature_C ~ lakename)
summary(LTER_July_Lakes_Anova_asLM)
```

```
##

```

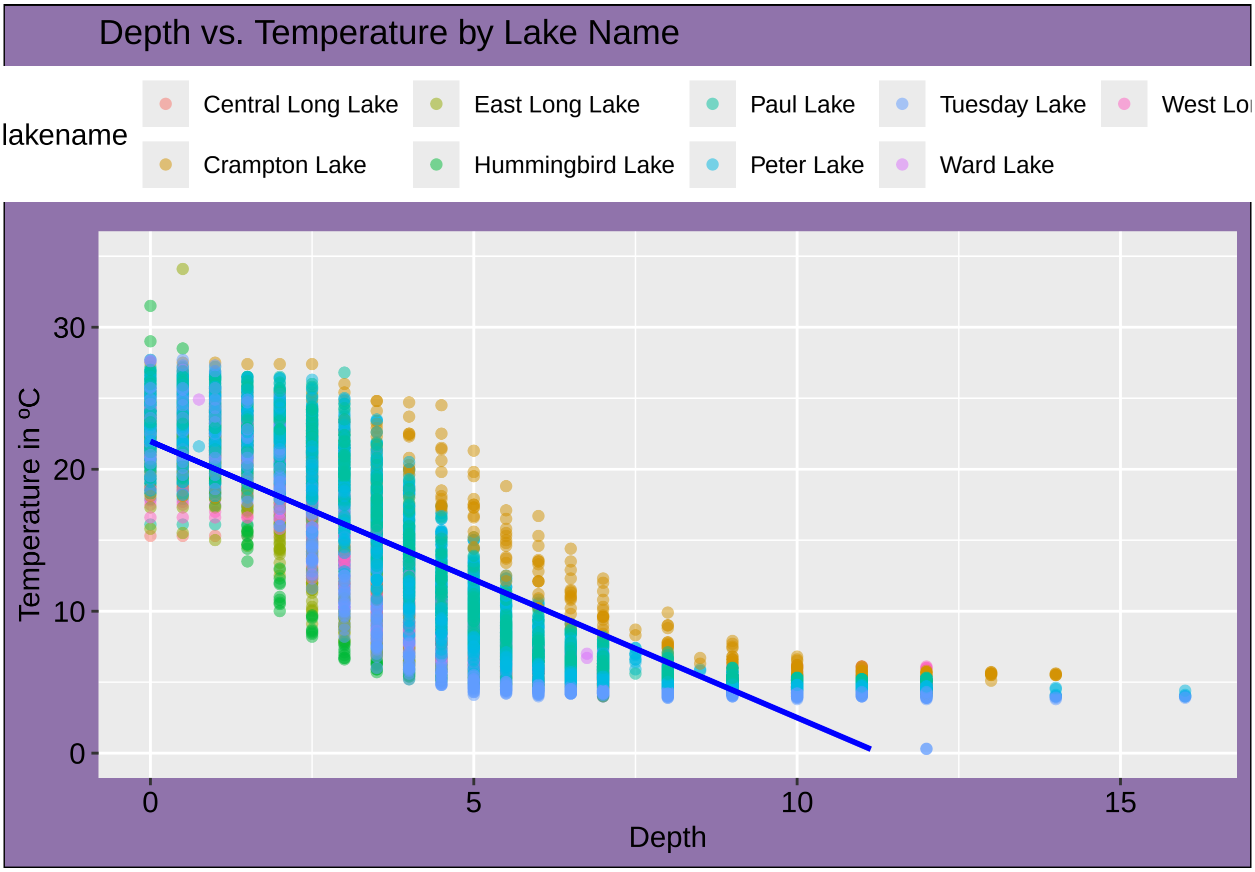
13. Is there a significant difference in mean temperature among the lakes? Report your findings.

    Answer: There is a signficant difference in mean temperature among lakes, as shown by the small p-value of 2.2e-26

14. Create a graph that depicts temperature by depth, with a separate color for each lake. Add a geom_smooth (method = "lm", se = FALSE) for each lake. Make your points 50 % transparent. Adjust your y axis limits to go from 0 to 35 degrees. Clean up your graph to make it pretty.

```
#14.
temp_by_depth_plot <-
  ggplot(LTER_Lake_ChemPhys_Wrangled_SReg, aes(x=depth,
                        y=temperature_C, color=lakename))+
  geom_point(alpha=0.5)+
  geom_smooth(method=lm, col="blue", se=FALSE)+
  ylim(0, 35)+
  xlab("Depth")+
  ylab("Temperature in ºC")+
  ggtitle("Depth vs. Temperature by Lake Name")

print(temp_by_depth_plot)
```



15. Use the Tukey's HSD test to determine which lakes have different means.

```
#15
TukeyHSD(LTER_July_Lakes_Anova)
```

```
##   Tukey multiple comparisons of means
##     95% family-wise confidence level
##
## Fit: aov(formula = temperature_C ~ lakename, data = LTER_Lake_ChemPhys_Wrangled_SReg)
##
## $lakename

16.From the findings above, which lakes have the same mean temperature, statistically speaking, as Peter Lake? Does any lake have a mean temperature that is statistically distinct from all the other lakes?

> Answer: Peter Lake is in group C, meaning that it has the same mean as Paul Lake and Ward Lake. There are no lakes that have a mean temperature that is statistically distinct from all of the other lakes since there are no lakes with unique groupings. This means that each lake shares a statistically same mean with at least one other lake.

17. If we were just looking at Peter Lake and Paul Lake. What's another test we might explore to see whether they have distinct mean temperatures?

> Answer: Another test we might use to see whether Peter and Paul lakes have distinct mean temperatures is a two-sample T-test. This test explores whether or not two samples have the same mean.

18. Wrangle the July data to include only records for Crampton Lake and Ward Lake. Run the two-sample T-test on these data to determine whether their July temperature are same or different. What does the test say? Are the mean temperatures for the lakes equal? Does that match you answer for part 16?

```
LTER_Lake_ChemPhys_Wrangled_CramptonWard <-
  LTER_Lake_ChemPhys_Wrangled_SReg %>%
  filter(lakename == "Crampton Lake" | lakename == "Ward Lake")

LTER_Crampton.Ward_t.test <- t.test(
   LTER_Lake_ChemPhys_Wrangled_CramptonWard$temperature_C ~ LTER_Lake_ChemPhys_Wrangled_CramptonWard$lal

LTER_Crampton.Ward_t.test
```

```
##
##  Welch Two Sample t-test
##
## data:  LTER_Lake_ChemPhys_Wrangled_CramptonWard$temperature_C by LTER_Lake_ChemPhys_Wrangled_Crampto
## t = 1.1181, df = 200.37, p-value = 0.2649
## alternative hypothesis: true difference in means between group Crampton Lake and group Ward Lake is
## 95 percent confidence interval:
##  -0.6821129  2.4686451
## sample estimates:
## mean in group Crampton Lake     mean in group Ward Lake
##                    15.35189                    14.45862
```

> Answer: The mean values for the two lakes are not equal. Crampton Lake has a slightly larger mean temperature of 15.35. compared to Ward Lake's mean of 14.46. This sort of matches the answer for part 16 as Ward Lake and Crampton Lake are both in group b, but Crampton is in group a and Ward is not. Likewise, Ward is in group c and Crampton is not.
